TS2 (3.1), H1+ and H2+ DIAG

I didn't find any new things , 100% same to spoto all the parts.

TS2:

Ticket1: Same thing to create "Route-map attack 20" and "action forward"
    Just User4 " int e0/0" have not dhcp properly config and check if its shutdown .
    Int e0/0 >> ip add dhcp client-id e0/0 and also Also added "lease infinite " R40"

Ticket2:

    Just "next-hop-self" was missing on both R14/R15 and I add the " ospf 1 area 0 " on SW111 "int vlan 2001"

Ticket3:

    Load balancing was the same as spoto mentioned to check the access-list and make them correct

    SW101 has the "ospf cost value" remove it by finding with command " Show run | s ospf "

    On R22 I add a " ip ospf cost 100" on interface that run to SW201.

Ticket4:

    The "BGP local preference 100 " was applied on both routers R21/R20 , I increased on R21 and also I added "ip ospf cost 100" on the R21 interface that's already spoto mentioned

Ticket5:

    Added "Ip ospf network point-to-multipoint" on R14,R60 and R51

Ticket6:

    I redistributed the ospf under BGP ipv6 address family

Ticket7:

    In MPLS check all the RTs . Few of them are wrong , follow spoto

    Also "mpls lable protocol" and " ldp router-id were missing .

    From SW502 trace to server-1 need to configure "ip ospf cost 100" on SW111's interface that run   to SW100 (link ID-23)

Ticket 8: Add "ip dhcp relay info trust" on both SW300/SW301's interface vlan 2001/2000

    Also added "lease infinite " R30"

Ticket9: tunnel key was wrong,

Ticket10: just added "ip nat outside source X X like spoto"

DIAG H2+

I spent much time on diagnosis because I want to verify all the answers , all found 100% as spoto

H1+ CFG.

Layer2 vlans were configured need to configure trunk , vtp pass with (?) mark CCIErocks? . I used to press "ctrl+v" for that to enter "?"

BGP was not configured, ospf was not configured , just few ebgp were preconfig on "34567"

R20 was configured about 5% and added "address familt ipv4" part

The rest of all things need to configured and didn't find any more preconfig.

But all the question hit the spoto 100%

I was forget a important part to configure on R20 " nei 10.120.15.1 weight 1000/nei 10.120.99.1 weight 100. It really made me worried but I got the pass result.

From the whole experience I found that if you don't panic or under pressure you can pass. Most of the student kill by pressure so never come under pressure
